Standard Specification for Stainless Steel Metric Bolts, Screws, and Studs

This standard is issued under the fixed designation F 738M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (e) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers the chemical and mechanical requirements for stainless steel metric bolts, screws, and studs with nominal thread diameters M1.6 through M36 and is intended for use in engineering applications requiring general corrosion resistance.

1.2 Eight groups of stainless steel alloys are covered, including three austenitic (Grades A1, A2, and A4), one ferritic (Grade F1), three martensitic (Grades C1, C3, and C4), and one precipitation hardening (Grade P1).

1.3 Twenty property classes are covered, including nine austenitic, two ferritic, eight martensitic, and one precipitation hardening. The property classes with the permissible alloys for each are listed in Table 1.

1.4 This specification is based in concept and content on ISO 3506. The chemical and mechanical requirements specified for all property classes, except as given in 1.4.1, are essentially identical with classes of the same designation in ISO 3506.

1.4.1 This specification includes all of the property classes covered in ISO 3506. Additionally, it includes property classes A1-70, A2-70, A4-70, A1-80, A2-80, and A4-80 for products with nominal thread diameters larger than M20; and four non-ISO property classes, C1-110, C4-110, C3-120; and P1-90.

1.5 Supplementary requirements of an optional nature are provided, applicable only when agreed upon between the manufacturer and the purchaser at the time of the inquiry and order.

1.6 Suitable nuts for use with bolts, screws, and studs included in this specification are covered by Specification F 836M.

1.7 The following safety hazards caveat pertains only to the test method described in this specification. This standard does not purport to address the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2.2 ISO Standard:
ISO 3506 Corrosion-Resistant Stainless Steel Fasteners

3. Classification

3.1 The designation of each property class is composed of three parts: a letter, followed by a single digit, followed by either two or three digits.

3.1.1 The letter indicates the general composition type of stainless steel as follows:

3.1.1.1 A for austenitic steels,
3.1.1.2 F for ferritic steels,
3.1.1.3 C for martensitic steels, and
3.1.1.4 P for precipitation-hardening steel.

3.1.2 The first digit (1, 2, 3, or 4) indicates the alloy group. The permissible alloys within each group are given in Table 1.

3.1.3 The last two or three digits (50, 70, 110, etc.) indicate 10% of the specified minimum tensile strength of the property class.

3.1.4 For example, Class A1-50 is an austenitic steel of any one of six permitted alloys, and the manufactured fastener has a minimum tensile strength of 500 MPa.

4. Ordering Information

4.1 Orders for bolts, screws and studs under this specification shall include the following:

4.1.1 Quantity (number of pieces of each item).
4.1.2 Name of item (bolt, screw, stud, etc.; specific type and style; and reference to dimensional standard when appropriate).
4.1.3 Size (nominal diameter, thread pitch, length).
4.1.4 Property class.
4.1.5 ASTM designation and date of issue. When date of issue is not specified, fasteners shall be furnished to the latest issue.
4.1.6 Supplementary requirements, if any (S1 through S5).
4.1.7 Additional requirements, if any, to be specified on the purchase order:

4.1.7.1 Forming (5.2.1).
4.1.7.2 Threading (5.2.2).
4.1.7.3 Alloy condition (5.2.3).
4.1.7.4 Protective finish (5.2.5).
4.1.7.5 Alloy selection (7.2).
4.1.7.6 Test report (9.2).
4.1.7.7 Heat number (9.1.1).
4.1.7.8 Additional testing (9.3).
4.1.7.9 Inspection (11.1).
4.1.7.10 Rejection (12.1).
4.1.7.11 Certification (13.1).
4.1.7.12 Marking (14.1.3 and 14.1.4).

5. Materials and Manufacture

5.1 Materials:

5.1.1 Specifications A 276, A 493, A 564/A 564M, and A 582/A 582M are noted for information only as suitable sources of material for the manufacture of bolts, hex cap screws, and studs to this specification.

5.2 Manufacture:

5.2.1 Forming—Unless otherwise specified, fasteners shall be cold-formed, hot-formed, or machined, at the option of the manufacturer.

5.2.2 Threads—Unless otherwise specified, threads shall be rolled or cut at the option of the manufacturer.

5.2.3 Condition—Fasteners shall be furnished in the condition specified for the property class in Table 2. If other conditions are required, the condition and resultant mechanical properties shall be as agreed upon between the manufacturer and the purchaser.

5.2.4 Surface Finish—Fasteners shall have a surface finish

---

Available from American National Standards Institute, 11 West 42nd Street, 13th Floor, New York, NY 10036.
produced in accordance with Practice A 380.

5.2.5 Protective Finishes—Unless otherwise specified, fasteners shall be furnished without an additive chemical or metallic finish.

6. Heat Treatment

6.1 Austenitic Alloys, Grades A1, A2, and A4

6.1.1 When Condition AF is specified, the fasteners, following manufacture, shall be annealed by heating to 1040 ± 30°C, at which time the chromium carbide will go into solution. The fasteners shall be held for a sufficient time and then cooled at a rate sufficient to prevent precipitation of the carbide and to provide the properties specified in Table 2.

### Notes:
- AF — headed and rolled from annealed stock and then reannealed.
- CW — headed and rolled from annealed stock, thus acquiring a degree of cold work; products with nominal thread diameters larger than M20 may be hot-worked and solution annealed.
- SH — machined from strain-hardened stock or cold worked to develop the specified properties.
- A — machined from annealed or solution-annealed stock, thus retaining the properties of the original material.
- H — hardened and tempered at 565°C minimum.
- HT — hardened and tempered at 275°C minimum.
- AH — solution-annealed and age-hardened after forming.
- "8D" means 8 times nominal diameter maximum.
- Tensile strength and yield strength values for full-size products of each property class are given in tables on yield and tensile strength.
- Yield strength is the stress at which an offset of 0.2 % gage length occurs.
- Extension measurement is determined in accordance with the test procedure specified in 10.2.3.
- Torsional strength requirements apply only to austenitic steel fasteners with nominal thread diameters M5 and smaller. Values are given in tables on torsional strength.
6.1.2 When Condition CW is specified, the austenitic alloy shall be annealed as specified in 6.1.1, generally by the raw material manufacturer, and then cold-worked to develop the properties specified in Table 2.

6.2 Ferritic Alloys, Grade F1

6.2.1 When Condition AF is specified, the ferritic alloy shall be heated to a temperature of 790 ± 30°C, held for an appropriate time, and then air-cooled to provide the properties specified in Table 2.

6.2.2 When Condition CW is specified, the ferritic alloy shall be annealed as specified in 6.2.1, generally by the raw material manufacturer, and then cold-worked to develop the properties specified in Table 2.

6.3 Martensitic Alloys, Grades C1, C3, and C4

6.3.1 When Condition A is specified, the fasteners, following manufacture, shall be annealed to provide the properties specified in Table 2.

6.3.2 When Condition H is specified, the fasteners shall be hardened and tempered by heating to 1010 ± 30°C sufficient for austenitization, holding for at least ½ h, rapid air- or oil-quenching, reheating to 565°C minimum, and holding for at least 1 h and then air-cooling to provide the properties specified in Table 2.

6.3.3 When Condition HT is specified, the fasteners shall be hardened and tempered by heating to 1010 ± 30°C sufficient for austenitization, holding for at least ½ h, rapid air- or oil-quenching, reheating to 275°C minimum, holding for at least 1 h, and then air-cooling to provide the properties specified in Table 2.

6.4 Precipitation-Hardening Alloy, Grade P1—When Condition AH is specified, the fasteners shall be solution-annealed and aged by heating to 1040 ± 15°C, holding for at least ½ h, rapid air- or oil-quenching to 27°C maximum, reheating to 620 ± 10°C minimum, holding for 4 h, and then air-cooling to provide the properties specified in Table 2.

7. Chemical Composition

7.1 It is the intent of this specification that fasteners shall be ordered by property class.

7.2 Unless otherwise specified in the inquiry and purchase order (see Supplementary Requirement S2), when two or more alloys are permitted for fasteners of a specified property class, the choice of alloy to be used shall be that of the fastener manufacturer as determined by his fastener fabrication methods and material availability. The specific alloy used by the manufacturer shall be clearly identified on any certification required in the purchase order and shall have a chemical composition conforming to the limits specified in Table 3.

7.2.1 When the purchaser specifies that a specific alloy be used, the alloy shall have a chemical composition conforming to the limits specified in Table 3.

7.3 Product analysis may be made by the purchaser from finished fasteners representing each lot. The chemical composition thus determined shall conform to the limits specified in Table 3.

*At manufacturer’s option, determined only when intentionally added.
Table 3 for the specific alloy within the product analysis tolerances specified in Specification A 555/A 555M.

7.3.1 In the event of discrepancy, a referee analysis of samples for each lot shall be made in accordance with 9.3.1.

8. Mechanical Properties

8.1 Bolts, screws, and studs shall be tested in accordance with the mechanical testing requirements for the applicable product type, property class, nominal thread diameter, length, and specified minimum tensile strength as specified in Table 4, and shall meet the mechanical requirements specified for that product in Tables 2-6.

8.2 For products on which both hardness and tension tests are performed, acceptance based on tensile requirements shall take precedence over low hardness readings.

9. Number of Tests and Retests

9.1 The requirements of this specification shall be met in continuous mass production for stock and the manufacturer shall make sample inspections to ensure that the product conforms to the specified requirements. Additional tests of individual shipments of material are not ordinarily necessary.

9.1.1 Individual heats of steel are not identified in the finished product. When specified in the purchase order that the heat number shall be identified for the products in an individual shipment, the manufacturer shall control the product by heat analysis and additionally shall conduct the testing program specified in 9.3.1.

</tbody>
</table>

*M* denotes a mandatory test. For each product, all mandatory tests shall be performed. In addition, either all tests denoted "FS" (which apply to full-size products) or all tests denoted "MS" (which apply to machined test specimens) shall be performed. In case of arbitration, tests shall be performed. Leaders (.) denote tests that are not required.

For values of length X, see Table 6.

Acceptance values for these tests are contained in Table 5.

Special-head bolts and screws are those with special configuration or drilled heads which are weaker than the threaded section.
9.2 When specified in the purchase order, the manufacturer shall furnish a test report certified to be the last complete set of chemical analysis and mechanical tests for each stock size in each shipment.

9.3 When the purchaser requires that additional tests be performed by the manufacturer to determine that the properties of products in an individual shipment are within specified limits, the purchaser shall specify the testing requirements, including the sampling plan and basis of acceptance, in the inquiry and purchase order.

9.3.1 When the purchaser does not specify the sampling plan and basis of acceptance the following shall apply:

9.3.1.1 The lot, for purposes of selecting samples, shall consist of all products offered for inspection and testing, at one time, that are the same type, style, nominal diameter, thread pitch, nominal length, material (alloy), property class, and surface finish.

9.3.1.2 From each lot, samples shall be selected at random and tested for each requirement in accordance with the following plan:

<table>

x equals the minimum length of product subject to tension testing.

F 738M
10. Test Methods

10.1 Chemical Analysis—The chemical composition shall be determined by any recognized commercial test method. In the event of discrepancy, Test Methods E 353 shall be used for referee purposes.

10.2 Mechanical Tests:

10.2.1 Bolts, screws, and studs are to be tested full size as determined by Table 4 for wedge tensile strength, axial tensile strength, yield strength at 0.2 % offset, and hardness in accordance with the methods described in Test Methods F 606M.

10.2.1.1 Test bolts, screws, and studs subject to wedge tension testing using hardened wedges based on the design described in Test Methods F 606M. The wedge shall be 10° when testing hex bolts and screws of nominal thread diameters M20 and smaller and 6° for sizes larger than M20; 6° when testing studs and hex flange screws of nominal thread diameters M20 and smaller and 4° for sizes larger than M20.

10.2.2 Test machined test specimens tested for tensile strength, yield strength, and elongation in accordance with the methods described in Test Methods F 606M.

10.2.3 Extension Test—The extension test is applicable only to full-size products. Measure the overall length of the test specimen ($L_1$). Assemble the specimen into a threaded adapter to a depth of one nominal diameter and then tension-test to failure. Fit the two broken pieces closely together and measure the overall length ($L_2$) again. Compute the total extension by subtracting the original overall length from the length following fracture (Fig. 1). The product is acceptable when the extension equals or exceeds the minimum value for extension specified in Table 2.

10.2.4 Torsional Strength Test:

10.2.4.1 Clamp the sample screw or stud securely by suitable means (Fig. 2) such that the threads in the clamped length are not damaged, and that at least two full threads project above the clamping device, and that a length equal to one nominal diameter, exclusive of point is held within the clamping device. A blind hole may be used in place of a threaded-clamping device, provided the hole depth is such as to ensure that breakage will occur beyond the point. By means of a suitably calibrated torque-measuring device, apply torque to the product until failure occurs. The product is acceptable when the torque required to cause failure equals or exceeds the minimum torsional strength specified in Table 7.

10.2.4.2 The calibrated-torque measuring device shall have a measuring range not exceeding five times and an accuracy of ±7 % of the specified minimum torque value (Table 7) of the product being tested.

10.2.5 For the purposes of determining compliance with the specified limits for properties listed in this specification, an observed value or calculated value shall be rounded in accordance with Practice E 29.

11. Inspection

11.1 If the inspection described in 11.2 is required by the purchaser, it shall be specified in the inquiry, order, or contract.

11.2 The inspector representing the purchaser shall have free entry to all parts of the manufacturer’s works that concern

![FIG. 1 Test Specimen-Extension Test](image-url)
the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All tests and inspection required by the specification that are requested by the purchaser's representative shall be made prior to shipment, and shall be so conducted as not to interfere unnecessarily with the operation of the work.

12. Rejection and Rehearing

12.1 Unless otherwise specified, any rejection based on tests specified herein and made by the purchaser shall be reported to the manufacturer within 30 working days from the receipt of the product by the purchaser.

13. Certification and Test Reports

13.1 Certificate of Compliance—Unless otherwise specified in the purchase order, the manufacturer shall furnish certifica-

tion that the product was manufactured and tested in accordance with the specification and the customer’s order, and conforms to all specified requirements.

13.2 Test Reports—When specified on the order, the manufacturer shall furnish a test report showing the chemical analysis of the fasteners and the results of the last completed set of mechanical tests for each lot of fasteners in the shipment.

14. Product Marking

14.1 Bolts, Screws, and Studs:

14.1.1 Unless otherwise specified, bolts and screws of nominal thread diameters smaller than M5, and studs M10 and smaller need not be marked. Additionally, slotted and recessed screws of nominal thread diameters M5 and larger need not be marked.

14.1.2 Bolts and screws of nominal thread diameters M5 and larger, and studs larger than M10 shall be marked with a symbol identifying the manufacturer. In addition, they shall be marked with the alloy/mechanical property marking specified in Table 2. The markings shall be raised or depressed at the option of the manufacturer.

14.1.3 When specified on the purchase order, other studs, bolts, and screws shall be marked. Markings shall be in accordance with 14.1.2 or as otherwise ordered by the purchaser.

14.1.4 Markings shall be located on the top of the head and either be raised or depressed at the option of the manufacturer.

15. Packaging and Package Marking

15.1 Packaging:

15.1.1 Unless otherwise specified packaging shall be in accordance with Practice D 3951.

15.1.2 When special packaging requirements are required by the purchaser, they shall be defined at the time of inquiry and order.

15.2 Package Marking—Each shipping unit shall include or be plainly marked with the following:

15.2.1 ASTM specification,

15.2.2 Alloy number,

15.2.3 Alloy/mechanical property marking,

15.2.4 Size,

15.2.5 Name and brand or trademark of the manufacturer,

15.2.6 Number of pieces,

15.2.7 Country of origin,

15.2.8 Purchase order number, and

15.2.9 Lot number, if applicable.

16. Keywords

16.1 bolts; general use; screws; stainless; studs

SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry and order 4.1.6. Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Additional Tests

S1.1 When tests for additional mechanical properties, corrosion resistance, etc., are desired by the purchaser, the test(s) shall be made as agreed upon between the manufacturer and the purchaser at the time of the inquiry or order.

S2. Alloy Control

S2.1 When Supplementary Requirement S2 is specified on the inquiry and order, the manufacturer shall supply that alloy specified by the customer on his order with no group substitutions permitted without the written permission of the purchaser.

S3. Permeability

S3.1 When Supplementary Requirement S3 is specified on the inquiry and order, the permeability of bolts, screws, and studs of Grades A1, A2, and A4 in Conditions A or AF shall not exceed 1.5 at 100 oersteds when determined by Test Methods A 342.

S4. Passivation

S4.1 When Supplementary Requirement S4 is specified on the inquiry or order, the finished product shall be passivated in accordance with Practice A 380.

S5. Shipment Lot Testing

S5.1 When Supplementary Requirement S5 is specified on the order, the manufacturer shall make sample tests on the individual lots for shipment to ensure that the product conforms to the specified requirements.

S5.2 The manufacturer shall make an analysis of a randomly selected finished fastener from each lot of product to be shipped. Heat or lot control shall be maintained. The analysis of the starting material from which the fasteners have been manufactured may be reported in place of the product analysis.

S5.3 The manufacturer shall perform mechanical property tests in accordance with this specification and Guide F 1470 on the individual lots for shipment.

S5.4 The manufacturer shall furnish a test report for each lot in the shipment showing the actual results of the chemical analysis and mechanical property tests performed in accordance with Supplementary Requirement S5.

S6. Heat Control

S6.1 When Supplementary Requirement S6 is specified on the inquiry or order, the manufacturer shall control the product by heat analysis and identify the finished product in each shipment by the actual heat number or lot number that is heat lot traceable.

S6.2 When Supplementary Requirement S6 is specified on the inquiry and order, Supplementary Requirements S2 and S5 shall be considered automatically invoked with the addition that the heat analysis shall be reported to the purchaser on the test reports.
